

# Cockroach Spray Treatment Preparations Guide

## Nature of treatment:

We utilize a coarse spray of WSG Seclira as spot and/or crack and crevice application into hiding places and entry points such as cracks and crevices, void areas, moist areas, openings around pipes and sinks, behind and around refrigerators or other appliances, across lower doorway frames and window openings.

The technician will inquire upon your concerns and observations and then explain the application parameters before starting the work.

## KITCHEN

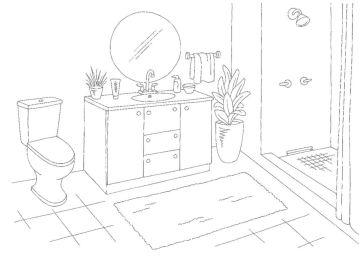

- Empty out and clean all cabinets with particular attention to detail for the ones under the sink and garbage disposal.
- You may place these removed items in the middle of a room so that one can walk around them.
- Around the kitchen sink, there should be no sponges, soap containers, etc.
- Disconnect and remove all appliances from counter tops. If an appliance need its bottom or back treated, please ask the technician.
- Clean and mop behind the refrigerator and the stove.
- **All the counter space should be cleared off, empty and cleaned.**

Our technician will apply spray treatment as crack and crevice in all key areas of cabinetry such as slits, gaps, voids, conduit openings and other spots where pests may nest or hide. The rear bottom refrigerator and similar hiding spots of stove may be investigated.

You may remove drawers along with their contents and put them away in a room rather than emptying out. Obviously, the removed items are not treated.

# WASHROOMS

- Similarly, empty out and clean all washroom cabinets particularly the one under the sink.
- You may remove drawers along with their contents and put them away in a room rather than emptying out.

## Recommendations, after the spray treatment:

All people and pets are to remain out of the treated property for at least 4 hours after the application.

After your return, it is recommended to ventilate the property by opening windows, etc for at least 20 minutes.

As an affect of the spray application, you may notice a lot of dead and dying cockroaches in coming days.

**Cleaning:** Avoid spraying chemicals for cleaning or other purposes. Most substances will degrade the applied pesticides and decrease the effectiveness of the treatment.

Make use of paper towel as you want to discard them after use. Dampen a paper towel with water and **wipe down all counter surfaces before using them for food preparations.**

It is best to vacuum as compared to moping or brushing. If you do mop, try not to scrub off the baseboards and kick plates in and near the kitchen areas.

If the technician finds any environmental issues that may be of critical importance (such as water leaks, etc), please, address them at your earliest convenience.

Please, ensure that every night you leave the kitchen counters and sinks as dry as possible.

## What to expect from the treatment:

Over next 3 - 5 weeks cockroaches will gradually become affected and continue to die off. There should be no cockroaches alive at the end of 6 week period. Otherwise, a follow up treatment is warranted.

Once, you have observed a complete elimination of cockroaches, it is okay to clean off all the treated surfaces by mopping or wiping.
